1. Why does the data communication industry use the layered [OSI reference model](#)? (Choose two.) A:It divides the network communication process into smaller and simpler components, thus aiding component development, design, and troubleshooting. B:It enables equipment from different vendors to use the same electronic components, thus saving research and development funds. C:It supports the evolution of multiple competing standards, and thus provides business opportunities for equipment manufacturers. D:It encourages industry standardization by defining what functions occur at each layer of the model. E:It provides a means by which changes in functionality in one layer require changes in other layers. Correct Answers: A, D Explanation: The [OSI](#) (Open System Interconnection) reference model was created as a reference point for communications devices. A layered approach is used to segment the entire telecommunications process into a series of smaller steps. A is correct because it encourages a level of standardization by encouraging that functions be compared to known layers. D is also correct because it allows engineers to focus on the development, refining, and perfection of simpler components.

2. Which of the following are types of flow control? (Choose three.) A:buffering B:cut-through C>windowing D:congestion avoidance E:load balancing Correct Answers: A, C, D

A: send ACK 1-3 B: send ACK 3 C: send ACK 4 D: send ACK 4-6 E: send ACK 6 F: send ACK 7 Correct Answers: C
Explanation: TCP is known as a reliable service. Reliable data delivery ensures the integrity of a stream of data sent from one machine to the other through a fully functional data link. It guarantees that the data won't be duplicated or lost. This is achieved through something called positive acknowledgment with retransmission a technique that requires a receiving machine to communicate with the transmitting source by sending an acknowledgment message back to the sender when it receives data. The sender documents each segment it sends and waits for this acknowledgment before sending the next segment. When it sends a segment, the transmitting machine starts a timer and retransmits if it expires before an acknowledgment is returned from the receiving end. In this case, 3 segments were received, so the receiver sends back an ACK value of 4 as it is expecting the 4th segment next.
