Internetwork Expert - CCIE Voice Advanced Technologies Class

INE's CCIE Voice Deep Dive learning modules are the next step to fully understanding complex CCIE level technologies. Every possible technology you need to know for the CCIE Voice lab will be described in extremely verbose detail using what we call a "Deep Dive" approach. This approach combines various features from a live, instructor-led class where every GUI and CLI interface found in the CCIE Voice Lab Exam is thoroughly covered, and everything is tested live and troubleshot. The format of each Deep Dive module is focused around a carefully developed training methodology that INE has found highly effective in not only communicating, but also causing the student to develop a highly technical acumen for both the important conceptual theory and the implementation & troubleshooting aspect of every topic. **Intended Audience**   CCIE Voice candidates who already have a CCVP or equivalent level of knowledge. This bootcamp will also benefit CCIE candidates who have attempted the actual CCIE Voice Lab Exam without passing and feel they need to take their knowledge and understanding of such crucial topics as Call Routing, Messaging, Presence, and Advanced CUCM features to the next level before attempting the CCIE Lab again.   After completing the CCIE Advance Technologies Bootcamp, you will be prepared to do the labs in the CCIE Voice Workbook Volume 1 and the CCIE Voice Workbook Volume 2. **At a Glance**   * This Class on Demand is covered by our exclusive Investment Protection Program   * Approximately 40+ hours of recorded lecture.   * The amount of material covered, and the detail of information, is not found in any other workbook on the market.   * Access to the material is available 24 hours a day, 7 days a week.   * Developed by the authors you know and trust to provide only the best material.
