QUESTION 91 Hotspot Question You manage two cloud services named Service1 and Service2. The development team updates the code for each application and notifies you that the services are packaged and ready for deployment. Each cloud service has specific requirements for deployment according to the following table.

Name	Deployment requirements
Service1	<ul style="list-style-type: none">You must be able to re-deploy the service using a previous package.The package must be retained for disaster recovery purposes.
Service2	<ul style="list-style-type: none">Maintaining the existing service package is not required.

In the table below, identify the deployment method for each service. Make only one selection in each column. Answer Area

Deployment method

Manually update DLL on cloud service by means of RDP.

Update by using package in Azure Storage.

Update by using package from your local computer.

Answer: Answer Area

Deployment method	Service1	Service2
Manually update DLL on cloud service by means of RDP.	<input type="radio"/>	<input type="radio"/>
Update by using package in Azure Storage.	<input type="radio"/>	<input checked="" type="radio"/>
Update by using package from your local computer.	<input checked="" type="radio"/>	<input type="radio"/>

QUESTION 92 You administer a cloud service. You plan to host two web applications named contosoweb and

contosowebssupport. You need to ensure that you can host both applications and qualify for the Azure Service Level Agreement. You want to achieve this goal while minimizing costs. How should you host both applications? A. in different web roles with two instances in each web role B. in the same web role with two instances C. in different web roles with one instance in each web role D. in the same web role with one instance Answer: B QUESTION 93 Your company has two physical locations configured in a geo-clustered environment that includes: - System Center Virtual Machine Manager 2012 R2 - System Center Data Protection Manager 2012 R2 - SQL Server 2012 - Windows Server 2012 R2 Hyper-V - Over 100 virtual machines (VMs) in each physical location Your company has recently signed up for Azure. You plan to leverage your current network environment to provide a backup solution for your VMs. You need to recommend a solution that ensures all VMs are redundant and deployable between locations. You also want the solution to minimize downtime in the event of an outage at either physical location. Which solution should you recommend? A. Configure a backup vault in Azure and use Data Protection Manager to back up The Windows Servers. B. Use Data Protection Manager and back up the VMs in each location. C. Use Azure site recovery in an on-premises to Azure protection configuration. D. Use Azure site recovery in an on-premises to on-premises protection configuration. Answer: D QUESTION 94 You manage an application running on Azure Web Sites Standard tier. The application uses a substantial amount of large image files and is used by people around the world. Users from Europe report that the load time of the site is slow. You need to implement a solution by using Azure services. What should you do? A. Configure Azure blob storage with a custom domain. B. Configure Azure CDN to cache all responses from the application web endpoint. C. Configure Azure Web Site auto-scaling to increase instances at high load. D. Configure Azure CDN to cache site images and content stored in Azure blob storage. Answer: A QUESTION 95 You manage a set of virtual machines (VMs) deployed to the cloud service named fabrikamVM. You configure auto scaling according to the following parameters: - With an instance range of two to six instances - To maintain CPU usage between 70 and 80 percent To scale up one instance at a time - With a scale up wait time of 30 minutes - To scale down one instance at a time - With a scale down wait time of 30 minutes You discover the following usage pattern of a specific application: The application peaks very quickly, and the peak lasts for several hours. CPU usage stays above 90 percent for the first 1 to 1.5 hours after usage increases. After 1.5 hours, the CPU usage falls to about 75 percent until application usage begins to decline. You need to modify the auto scaling configuration to scale up faster when usage peaks. What are two possible ways to achieve this goal? Each correct answer presents a complete solution. A. Decrease the scale down wait time. B. Decrease the scale up wait time. C. Increase the number of scale up instances. D. Increase the scale up wait time. E. Increase the maximum number of instances. Answer: BC QUESTION 96 Your company network has two physical locations configured in a geo-clustered environment. You create a Blob storage account in Azure that contains all the data associated with your company. You need to ensure that the data remains available in the event of a site outage. Which storage option should you enable? A. Locally redundant storage B. Geo-redundant storage C. Zone-redundant storage D. Read-only geo-redundant storage Answer: D QUESTION 97 You develop a set of Power Shell scripts that will run when you deploy new virtual machines (VMs). You need to ensure that the scripts are executed on new VMs. You want to achieve this goal by using the least amount of administrative effort. What should you do? A. Create a new GPO to execute the scripts as a logon script. B. Create a SetupComplete.cmd batch file to call the scripts after the VM starts. C. Create a new virtual hard disk (VHD) that contains the scripts. D. Load the scripts to a common file share accessible by the VMs. E. Set the VMs to execute a custom script extension. Answer: A QUESTION 98 You manage a virtual Windows Server 2012 web server that is hosted by an on-premises Windows Hyper-V server. You plan to use the virtual machine (VM) in Azure. You need to migrate the VM to Azure Storage to add it to your repository. Which Azure Power Shell cmdlet should you use? A. Import-AzureVM B. New-AzureVM C. Add-AzureDisk D. Add-AzureWebRole E. Add-AzureVhd Answer: E QUESTION 99 You administer of a set of virtual machine (VM) guests hosted in Hyper-V on Windows Server 2012 R2. The virtual machines run the following operating systems: - Windows Server 2008 - Windows Server 2008 R2 - Linux (openSUSE 13.1) All guests currently are provisioned with one or more network interfaces with static bindings and VHDX disks. You need to move the VMs to Azure Virtual Machines hosted in an Azure subscription. Which three actions should you perform? Each correct answer presents part of the solution. A. Install the WALinuxAgent on Linux servers. B. Ensure that all servers can acquire an IP by means of Dynamic Host Configuration

Protocol (DHCP). C. Upgrade all Windows VMs to Windows Server 2008 R2 or higher.
D. Sysprep all Windows servers. E. Convert the existing virtual disks to the virtual hard disk (VHD) format. Answer: ACE
QUESTION 100 You administer a virtual machine (VM) that is deployed to Azure. You configure a rule to generate an alert when the average availability of a web service on your VM drops below 95 percent for 15 minutes. The development team schedules a one-hour maintenance period. You have the following requirements: - No alerts are created during the maintenance period. - Alerts can be restored when the maintenance is complete. You want to achieve this goal by using the least amount of administrative effort. What should you do from the Management Portal? A. Select and disable the rule from the Dashboard page of the virtual machine. B. Select and delete the rule from the Configure page of the virtual machine. C. Select and disable the rule from the Monitor page of the virtual machine. D. Select and disable the rule on the Configure page of the virtual machine. Answer: C
